

CAMP OF JARBIDGE HAS SOME FINE ORE BODIES

Interesting Description of Coming Gold Camp Written by One on the Ground

The following communication descriptive of the Jarbridge district, is taken from the National Miner:

The full scope of the Jarbridge district as a great mineral section is little comprehended by those who are beyond the confines of this excellent gold belt. Recently it was the privilege of the writer to visit this section and under the guidance of the Walker boys, peeped into the treasure vaults of the North Star, the Success, the Pick and Shovel, the Bourne, all splendid properties, with great bodies of ore of the milling quality. In addition to these mines with quantitative milling bodies of ore there are numerous good prospects throughout that wide area and extending along an eight-mile trend.

Notably is this true of the Tabak group of six full claims and comprising about 120 acres of mineralized territory. The group has an abundance of water for all domestic and for all power purposes. Part of these claims are covered with the best of timbers. Trees ranging from one to four feet in diameter and from 50 to 100 feet high of the pine and fir variety are on the property and much such timber for mining purposes and buildings can be cut.

This property is to the south end of the district. It is only accessible by foot trail. The group is within three miles of the newly connected wagon road from Deeth into Jarbridge and a road for a moderate sum could be constructed to the junction of the Deeth highway. The ledges, goldbearing, trend north and south with an easterly dip having for a footwall a quartzite with a hanging schist. The main vein is readily traced and has been prospected for 3000 feet. At points this mineral expression is 40 feet wide. Values are mainly in the quartz, sometimes in oxidized, carbonate and chloride

form. As depth is attained the ores show the sulphide blend. An open cut 32 feet long and three feet wide and a 16-foot face shows the massiveness of this ore deposit running in values from \$4.60 to \$22.43 in gold and silver per ton. A 100-foot crosscut tunnel run on this lead maintains such mineralization without encountering the hanging wall. The last thirty feet were in ore of value and nature as described in open cut. The crosscut had not encountered the hanging wall. The backage by this tunnel is 60 feet at the deepest point.

On the same property is another ledge about 2000 feet north. The vein is seven feet wide, and a shaft sunk to 14 feet returns an average of \$5.65 per ton in free milling ore. Intermediate of these veins location work opened another lead of one foot. It is a rose-colored quartz heavily impregnated with galena and carries gold and silver values as a by-product. The total values of this rose quartz fissure is \$16.

The reason that I am referring specifically to the Tabak is from the fact that it simply illustrates the character of the good prospects abounding throughout the Jarbridge district in conjunction with the three main developed properties that are at the present installing milling plants to treat the large bodies of ore blocked and constantly being enlarged by new work.

The Jarbridge district with its natural facilities is a splendid opening for capital. The ores being of large bodies and the milling sort, but once equipped these show the fasting features that make Homestake, S. D., and the Treadwell of Alaska such durable money makers and sound properties for capital to industrialize.

The men here are at work building the foundations that forecast a rich, prosperous future for Northern Elko county.

the 2100 level of the Ophir has given some high average values for several days the past week, and it is probable that the average for the week will be considerably above that of the last report. Portions of this vein have proved to carry very rich values, as have been frequently shown ever since the present workings were opened up. The vein has been a wonderful producer during the past year or more. On the 2200 the south drift has uncovered some very good values during the week, and the production should show an increase this week. The prospecting work on the 2400 and 2500 levels has been pushed forward, the south drift on the 2400 having advanced through quartz and vein formation for the week. The south drift on the 2500 continues in vein formation and birdseye porphyry.

Sinking below the 1650 in Con. Virginia gives no change in the formation and on the 2450 the north drift is in vein formation. The crosscut on the 2650 is driving ahead through porphyry. Preliminary work in the new pumping plans on the 2650 is being advanced, and also in the old north and south drifts on the 2500 of the Ophir.

In the Union Consolidated the north drift is being advanced from the Mexican side, and is said to be opening up a big body of low-grade quartz. The quartz is more solid than it has been, but the values are still low. It is a fine, strong formation. The point winze with Sierra Nevada is going down at the usual pace, with little or no change in the bottom. The pump has been put in place in the winze.

Removing the buildings at the surface around the gallows frame continues at the Ward shaft, and on the 2000, the Julia Con. connecting drift is following up the diamond drill hole. In the Gold Hill drainage drift the diamond drill was sent through soft ground and it has been necessary to ream and ease the drill hole. New gears have been placed on the 2100 station pumps and a new check valve put in. Motors are being set up on the 2475, the centrifugal pump having been installed. Cutting out for the concrete dam on the 2450 Combination drift is about completed.

FIST FIGHT ENDS IN DUEL WITH SABRES

BUDAPEST, Hungary, Aug. 5.—A lively fist fight to be followed by a duel with sabres enlivened yesterday's proceedings in the lower chamber. An interruption of a debate started a row and Herr Pozsgay, a Kossuth partisan, made a dive for Herr Pal of the government side. The latter met Pozsgay half way, dealing him a staggering blow between the eyes. Confusion followed and the president was obliged to suspend the session. Subsequently a duel to take place later in the day was arranged.

When Cupid shoots an arrow his victim feels the quiver.

IDENTIFY BONES AS ENGINEER OF LOST BATTLESHIP

REMAINS FOUND ON WRECKED MAINE SUPPOSED TO BE MERRITT'S.

HAVANA, Aug. 5.—The bones found yesterday in the wardroom of the battleship Maine were identified yesterday as those of Assistant Engineer Merritt. The identification was based on the configuration of the skull.

The bones were discovered at the precise spot where Midshipman Boyd testified he and Merritt had been separated by the rush of water while struggling to make their way from the junior officers' wardroom to the main deck. The bones have been placed in a casket to await instruction from Merritt's family.

Two more bodies, the identification of which was impossible, were found yesterday near the warrant officers' quarters on the port side of the berth deck, under the central superstructure, making the total number recovered 21.

KNIGHTS OF COLUMBUS.

DETROIT, Mich., Aug. 5.—The Knights of Columbus' annual convention elected James A. Flaherty of Philadelphia, supreme knight, and Martin Carmody of Grand Rapids, Mich., deputy supreme knight. The national board of directors includes James McGraw of Oklahoma City.

MONSTER COMBINATION.

ST. LOUIS, Aug. 5.—The Roberts, Johnson & Rand Shoe company and the ePters Shoe company have consolidated with a capital of \$20,000,000. The concern will operate 18 shoe factories and will have 8500 employees.

UNIVERSITY OF NEVADA.

Reno, Nevada, 26th year begins August 14, 1911.

Courses in agriculture and domestic science in the college of agriculture.

Courses in the languages, history and economics, mathematics and the natural sciences in the college of arts and science.

Courses in mining engineering and metallurgy, mechanical and electrical engineering and civil engineering in the college of engineering.

Courses in education, elementary and advanced in the college of education.

The university high school, preparatory to the college certificate from recognized high schools accepted, general supervision by faculty of all out-door sports.

For catalogue and illustrated circulars address President J. E. Stubbs, Reno, Nevada.

RESULTS OF PAST WEEK IN THE COMSTOCK MINES

Ophir Vein Shows Up Strong and Mexican Hoisting Large Amount of Ore

Report of the mines on the Comstock for the past week is given by the Virginia Chronicle as follows:

Routine development work, with a lack of sensational features, but with excellent progress and results at all points, sums up the situation in the local mines this week, and with a likelihood of an ore output reported on Saturday equal to, if not exceeding, that of last week. In Ophir, the assays have given some very good returns from the Hardy vein, somewhat above the average, and the same is true from the 2500-foot level of the Mexican. In the latter mine, work is being largely concentrated as a week ago, on the 2500 level, where advancing north and widening out is in progress, preparatory to sinking a winze below the 2500 and stopping above. No effort is apparently being made for a large ore extraction for the material is broken down in cutting out for timbers, and taken as it comes, without segregation. Some of the cars, however, run very high in assay value and there is a large tonnage of second-class ore being hoisted. The developments to date on the 2500 in the ore are about 110 feet in length, and vary in width from 15 to 20 feet, and before the widening out process is complete, will be fully 30 feet wide in places, all giving values from milling to shipping grade.

Word has been received that the electric hoist for the 2500 winze has been shipped from the coast, which means that it will soon be on the ground. It will be installed immediately upon arrival, probably on the sill floor, and the electrical connections made. Sinking in the ore will no doubt be soon underway after the equipping of the hoist. Work in the stope is largely timbering and building another chute at the south end. When stopping begins for the mill, a large

tonnage will be possible daily. Connection with the 2300 has been made by the 2400 level raise, and timbering up at the point of connection. As soon as this is finished work will be continued in the 2300 stope.

Stopping in the Hardy vein above
